

Warranty, Cleaning and Care of your pizza oven

Oven Warranty – applies to the Jalandó branded pizza ovens

There is a warranty of 1 year on your Jalandó Wood Fired Pizza oven from the date of delivery, as long as these curing and caring guidelines are adhered to.

Caring for your oven

Curing the Oven

Your oven is made from heat resistant clay and refractory materials, but the water used to form the clay must be cooked out before your oven can be used. This process is called 'Curing'. You achieve this by lighting a small fire in your oven 3 – 5 times over a period of 3 – 5 days for about 4-5 hours each time. The curing time depends on whether you have purchased a Jalandó DIY kit or Preassembled pizza oven (please refer to the Jalandó Curing Guide you received with your pizza oven for detailed instructions).

Protecting your Oven

If your oven is not under cover, it is advisable to place a tarp or Jalandó Pizza Oven cover on it to prevent water from entering your oven and to protect it from the elements. This will prolong the life of your oven.

Another tip is to waterproof your pizza oven - You may choose to waterproof your oven with a concrete sealer such as, Bondall Natural finish sealer or Crommelins Natural Diamond coat paving and concrete sealer or Dunlop premium natural look sealer. You would apply this sealer to the external render after the curing process is complete. We also stock acrylic roll-on render in a range of colours which when applied will further waterproof your oven.

Keeping the door slightly ajar will also allow any buildup of moisture to evaporate.

Overloading with Wood

Remember it is a pizza oven and not a heater and overheating and overloading with wood can damage the interior of your oven and cause excessive cracking. It can also cause the powder coating on the oven door and/or flue to blister.

Cleaning your Oven

Once you have finished cooking clean your oven floor by raking the remainder of the fire across the floor to the front of the oven and leave the door off overnight. You can clean the oven floor with a damp tea towel or a string mop.

The next morning, push back the coals and ensure the oven floor is clean of any food residue. It is recommended that you use your Jalandó Pizza oven rake, shovel and brush to complete the cleaning process.

Keep the door on after cleaning and when not in.

Thermal Shock

Floor bricks cracked

High temperatures can cause pressed bricks to fail. It is important to heat your pizza oven slowly by placing wood in gradually, rather than putting too much in at once. piling too much wood in at once. If you heat it up too quickly you may cause thermal shock which will result in cracked floor tiles.

Overheating an uncured oven can cause thermal shock or cracks in the clay and should be avoided. It is important that you follow the "Curing your Oven Instructions" that we have provided you with.

Oven Cracks

Hairline cracks

The high temperatures that your wood fired pizza oven reaches (up to 450 degrees c) will create small natural cracks and dilatations on the interior and exterior of your refractory clay oven. This is a completely normal and natural process due thermal dilatation and will not affect the normal functioning of your Pizza oven. These generally occur during the settling in stage when some expansion occurs and are not structural defects.

Can I fix the cracks that appear in my oven?

If you would like to repair the cracks that appear in your oven you can use Selleys 401 Industrial grade silicone, but you must only use this externally, around the base of the flue or on the cracks. This will be clear in color, but you can also paint the exterior with paint or our acrylic Roll-on-Render. This acrylic render will expand and shrink with your oven due to the elasticity of this product and therefore will minimize the appearances of cracks if applied to your oven any time after the initial curing process. (Please follow the application instructions on the tin)
