- Stainless Steel \$129.00
- Black Painted \$149.00

Flue Flashing

- BAL 12.5 No. 7 \$69.00

When installing a pizza oven, especially one that uses wood or gas, ensuring proper clearance from combustible materials such as walls, posts, ceiling or plants, is crucial for safety.

1. Clearance for Safety:

- Maintain adequate distance from combustible materials like walls, posts, ceilings, rafters and plants to prevent fire hazards.
- Recommended Flue clearances:
 - 750mm for single skin.
 - 75mm for double skin.
 - 50mm for triple skin flues.
- Recommended Pizza Dome clearances:
 - 50mm from the sides and back of the oven dome
 - 400mm above the oven dome.
 - 700mm in front of the oven.

2. Flue Installation:

- For flues within 3m of the roof ridge, they must extend at least 600mm above the ridge.
- If further than 3m, they should extend at least 1m above the roof.
- Use a triple skin flue kit for installations under a combustible ceiling to enhance safety.

3. Professional Installation:

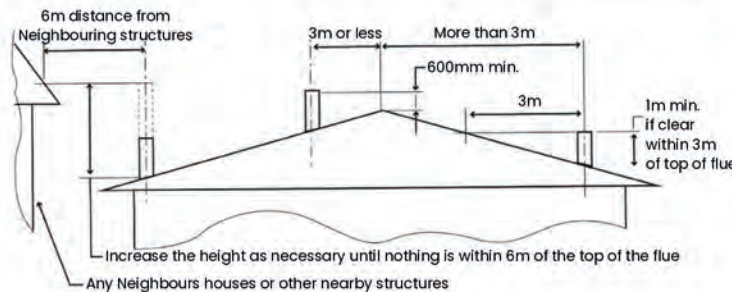

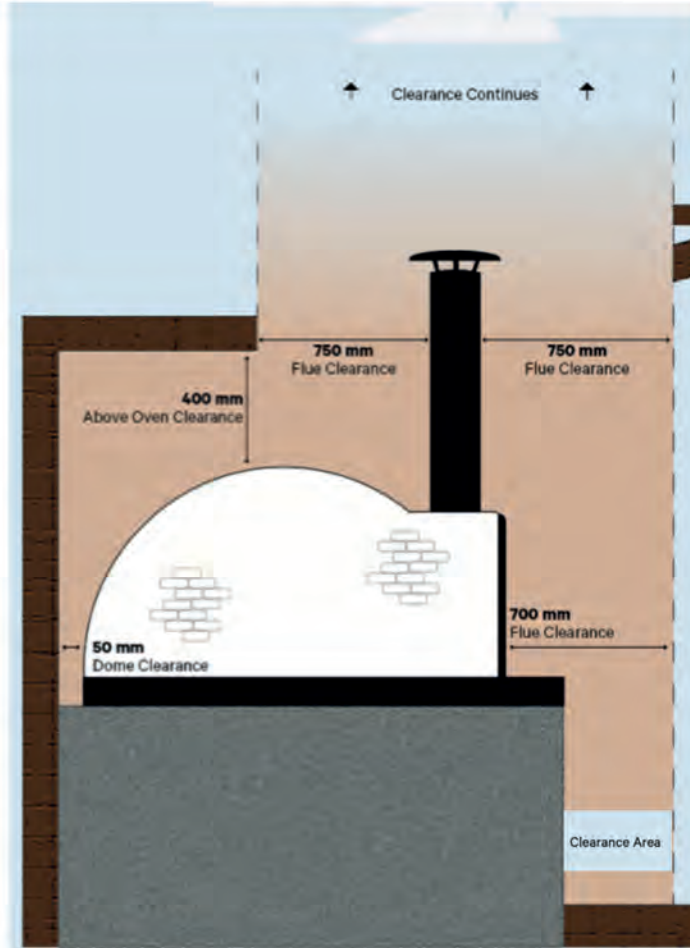

- Engage a licensed plumber to ensure the installation meets AS/NZS 2918:2018 standards and complies with local council regulations.
- Obtain a Certificate of Compliance for council and insurance purposes.

4. Council Regulations:

- Check with your local council for any specific restrictions before starting the installation.

5. Maintenance:

- Regularly inspect the pizza oven and flue to ensure ongoing safe operation.
