Flue Flashing

BAL 12.5 No. 7	\$69.00
BAL 12.5 No. 8	\$79.00
BAL 12.5 Tile5	\$190.0

When installing a pizza oven, especially one that uses wood or gas, ensuring proper clearance from combustible materials such as walls, posts, ceiling or plants, is crucial for safety.

Clearance for Safety:

Maintain adequate distance from combustible materials like walls, posts, ceilings, rafters and plants to prevent fire hazards.

Recommended Flue clearances:

- 150mm for single skin.
- 50mm for double skin.
- 25mm for triple skin flues.

Recommended Pizza Dome clearances:

- 50mm from the sides and back of the oven dome
- 400mm above the oven dome.
- 700mm in front of the oven.

Roofline Clearance:

The top of the flue must be at least 600mm above the roofline.

Proximity to Ridge:

- If the flue is within 3 meters of the ridge, it must protrude at least 600mm above the ridge.
- If the flue is more than 3 meters from the ridge, it must protrude at least 1000mm above the roof penetration.

Clearance from Structures:

The flue must be more than 3 meters from any nearby structure.

Other Considerations:

- The flue should be installed vertically and straight.
- The end of the flue must not be positioned near openings such as windows or doors.
- The size of the flue has to be in proportion to the size of the unit to prevent any excess smoke from re-entering your home.

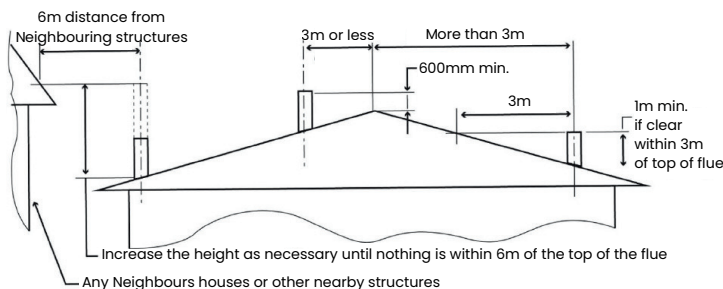

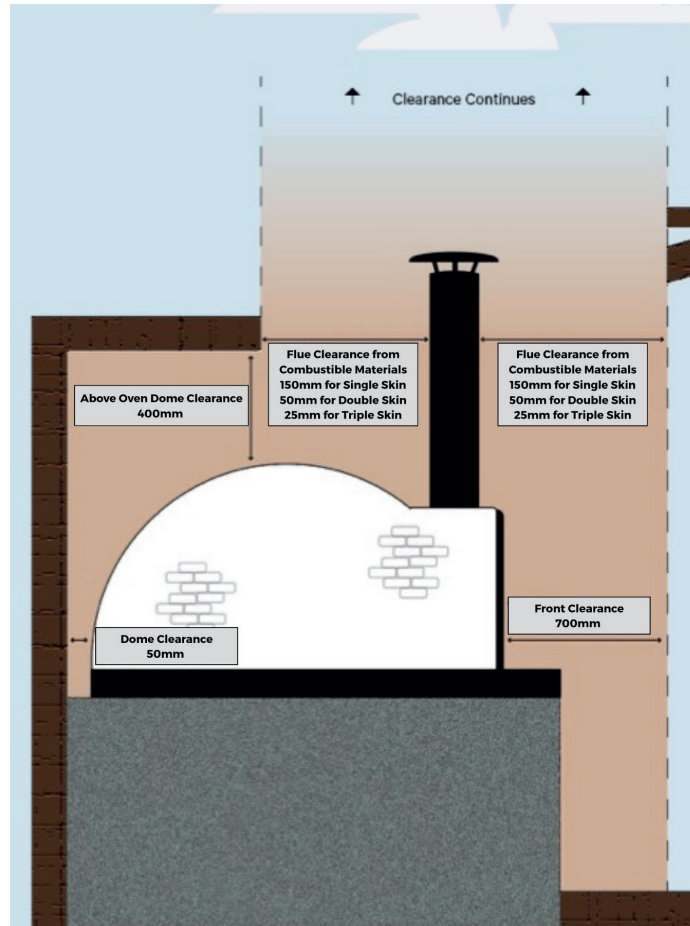

Council Regulations:

Check with your local council for any specific restrictions before starting the installation.

Maintenance:

Regularly inspect the pizza oven and flue to ensure ongoing safe operation.

Standard: These regulations are based on Australian Standard AS/NZS 2918:2001.
